Packages

Here are the packages with brief descriptions (if available):

<u>r_rest Crawl N Calculate Data</u>	5
<u>r_rest Login Behaviour</u>	9
<u>r_rest Post Behaviour</u>	10
<u>r_rest Service</u>	11
<u>r_rest Thread Overview</u>	16

Class Index

Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<u>r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data</u>	17
<u>r_rest_Login_Behaviour.r_rest_Login_Behaviour</u>	25
<u>r_rest_Post_Behaviour.r_rest_Post_Behaviour</u>	27
<u>r_rest_Thread_Overview.r_rest_Thread_Overview</u>	28

File Index

File List

Here is a list of all files with brief descriptions:

<u>r_rest Crawl N Calculate Data.py</u>	30
<u>r_rest Login Behaviour.py</u>	31
<u>r_rest Post Behaviour.py</u>	32
<u>r_rest Service.py</u>	33
<u>r_rest Thread Overview.py</u>	34

Function Documentation

def r_rest_Service.crawl_n_calculate_data ()

Crawls author data, writes them into databases and prepares questions and answers depending on given parameters

This route is active, whenever the user
- clicked the refresh button on the (un)answered panel
- initially selected a thread on the left side panel

This route processes (sorting / filtering) settings for (un)answered questions panel

Args:

```
request.args.get('t_id') : The id of the thread being processed
request.args.get('u_f_t') : The selected tier - filter for unanswered questions (all / 1 / X)
request.args.get('u_s_e') : The selected score comparison - filter for unanswered questions
(eql / grt / lrt)
request.args.get('u_s_n') : The selected score value used for filter for unanswered
questions(any int)
request.args.get('u_s_d') : The selected sorting direction for unanswered questions (asc / des)
request.args.get('u_s_t') : The selected type to sort the data to (author / creation / score
/ random)

request.args.get('a_f_t') : The selected tier - filter for answered questions (all / 1 / X)
request.args.get('a_s_e') : The selected score comparison - filter for answered questions (eql
/ grt / lrt)
request.args.get('a_s_n') : The selected score value used for filter for answered questions(any
int)
request.args.get('a_s_d') : The selected sorting direction for answered questions (asc / des)
request.args.get('a_s_t') : The selected type to sort the data to (author / creation / score
/ random)
```

```

Returns:
1. thread_over_view_data (whenever if will be entered) (dict):

    'title' (str): [The written title of the thread]
    'amount_answered' (str): [The amount of questions already answered]
    'amount_of_questions' (str): [The overall amount of questions]
    'duration' (str): [The duration of the thread (in hours / days) depending
on internal calc]
    'thread_id' (str): [The id of the thread]

2. (un)answered question information sorted / filtered (dict):

    'extracted_an_filter_score_equals' (str): [Answered q: The score comparison (eq1 /
grt / lrt)]
    'extracted_an_filter_score_numeric' (str): [Answered q: The score value (int)]
    'extracted an filter tier' (str): [Answered q: The tier - filter (all / 1
/ Xx]
    'extracted_an_sorting_direction' (str): [Answered q: The sorting direction (asc
/ des)]
    'extracted an sorting type' (str): [Answered q: The sorting type
(author / creation / score / random)]

    'extracted_thread_id' (str): [The ID of the processed thread]

    'extracted_un_filter_score_equals' (str): [Unanswered q: The score comparison (eq1
/ grt / lrt)]
    'extracted un filter score numeric' (str): [Unanswered q: The score value (int)]
    'extracted_un_filter_tier' (str): [Unanswered q: The tier - filter (all /
1 / Xx]
    'extracted_un_sorting_direction' (str): [Unanswered q: The sorting direction (asc
/ des)]
    'extracted_un_sorting_type' (str): [Unanswered q: The sorting type
(author / creation / score / random)]

```

Definition at line 82 of file r_rest_Service.py.

def r_rest_Service.post_comment_to_reddit ()

Whenever the user clicked 'send' on the iAMA Experience prototype this route will be accessed and the comment will be posted to reddit

This route is active, whenever the user clicks the "send" button within the unanswered questions panel

It works the following way:

1. A REST-POST message, with the text inside its body to be uploaded to reddit will retrieved
 - 1.1. That post will be uploaded to reddit
2. The new information will be crawled from reddit and written into the database

Crawling it live from reddit instead of directly writing it into the database is more precise (i.E. in cases of utc epoch timestamp)

This route processes (sorting / filtering) settings for (un)answered questions panel

Args:

request.args.get('c id') (str) : The ID of the comment the author replied to
request.json['text'] (str) : The answer text of the author

Returns:

"Processed your posting request" (str) : The string, which will be given in return does not matter.

After successful return of that string a new ajax - REST - Call triggering information recrawl will be done.

Definition at line 181 of file r_rest_Service.py.

def r_rest_Service.return_css_files (*css_file*)

Whenever the webpage tries to access .css files they will be returned to it

Args:
css_file (str): The path to the requested .css - file

Returns:

(File): The requested .css - file

Definition at line 261 of file r_rest_Service.py.

def r_rest_Service.return_font_files (*font_file*)

Whenever the webpage tries to access font files they will be returned to it

Args:
font file (str): The path to the requested font file

Returns:

(File): The requested font file

Definition at line 229 of file r_rest_Service.py.

def r_rest_Service.return_img_files (*img_file*)

Whenever the webpage tries to access image files they will be returned to it

Args:
img file (str): The path to the requested image file

Returns:

(File): The requested image file

Definition at line 277 of file r_rest_Service.py.

def r_rest_Service.return_img_files_wrongly_directed (*img_file*)

Whenever the webpage tries to access image files they will be returned to it

Due to a unknown bug the website requests image files from within that folder.
That folder is mentioned nowhere, either in .html nor in .js - files.
Therefore we have to build this 'extra' route

Args:
img_file (str): The path to the requested image file

Returns:

(File): The requested image file

Definition at line 293 of file r_rest_Service.py.

def r_rest_Service.return_js_files (*js_file*)

Whenever the webpage tries to access javascript files they will be returned to it

Args:
js_file (str): The path to the requested .js file

Returns:

(File): The requested .js file

Definition at line 245 of file r_rest_Service.py.

def r_rest_Service.use_signin_key ()

```
Handles the call, whenever the user clicked "allow access" on Reddit-OAUTH2 - website

    Whenever the user successfully logged on to reddit he will be redirect to this route.

    After redirection, the given sign_key will be extracted and authentication within PRAW will
    be done with that
    key.

Args:
    request.args.get('code') (str) : The sign key returned by reddit

Returns:
    app.send_static_file('index.html'): If the authentication was successful the iAMA experience
    prototype will be
    displayed
```

Detailed Description

Definition at line 85 of file r_rest_Crawl_N_Calculate_Data.py.

Member Function Documentation

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.build_list_containing_q_n_a (self)[static]
```

```
Prepares data for display in the "answered questions" panel
```

```
    This method iterates over all answered questions and all answers the host made.  
    Furthermore it merges them together into pairs for a easy display of it on the website
```

```
Args:
```

```
self : Self reference - necessary to use methods within this class  
Returns:  
-
```

Definition at line 1020 of file `r_rest_Crawl_N_Calculate_Data.py`.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.calculate_down_votes  
()[static]
```

```
Calculates the amount of down votes of a thread  
  
This is actually not necessary anymore but will be left inside, whenever downvotes will be  
reimplemented  
to the website.  
  
Args:  
-  
  
Returns:
```

object (int): The amount of time difference between two values in seconds

Definition at line 678 of file `r_rest_Crawl_N_Calculate_Data.py`.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.calculate_question_stats (  
self)[static]
```

```
Calculates remaining question statistics, like average question score, reaction time and question  
creation  
interval in seconds  
  
Args:  
self: Self representation of the class [necessary to use methods within the class itself]  
Returns:  
-
```

Definition at line 571 of file `r_rest_Crawl_N_Calculate_Data.py`.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.calculate_time_difference (  
time_value_1, time_value_2)[static]
```

```
Calculates the time difference between two floats in epoch style and returns seconds  
  
Args:  
time_value_1 (float): The first time value to be used for calculation  
time_value_2 (float): The second time value to be used for calculation  
Returns:  
time_diff_seconds (int): The amount of time difference in seconds
```

Definition at line 702 of file `r_rest_Crawl_N_Calculate_Data.py`.

```
def  
r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.check_if_comment_has_been_an  
swered_by_thread_author ( self, author_of_thread, comment_acutal_id,  
comment_timestamp, comments_cursor)[static]
```

```
Checks whether both strings are equal or not
```

```

1. A dictionary containing flags whether that a question is answered by the host with the appropriate
timestamp
    will be created in the beginning.
2. Then the method iterates over every comment within that thread
    1.1. Whenever an answer is from the iAMA hosts and the processed comments 'parent id' matches
the iAMA hosts
comments (answers) id, the returned dict will contain appropriate values and will be returned
    1.2. If this is not the case, it will be returned in its default condition

```

Args:

```

self:    Self representation of the class [necessary to use methods within the class itself]
author_of_thread (str) : The name of the thread author (iAMA-Host)
comment_acutal_id (str) : The id of the actually processed comment
comment_timestamp (float): The timestamp of the currently processed comment
comments cursor (Cursor) : The cursor which shows to the amount of comments which can be iterated

```

Returns:

```

True (bool): Whenever the strings do not match

```

False (bool): Whenever the strings do match

Definition at line 804 of file `r_rest_Crawl_N_Calculate_Data.py`.

def

`r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.checker_comment_is_not_from_thread_author (author_of_thread, comment_author)[static]`

Checks whether both strings are equal or not

```

1. This method simply checks whether both strings match each other or not.
    I have built this extra method to have a better overview in the main code..

```

Args:

```

author of thread (str) : The name of the thread author (iAMA-Host)
comment_author (str) : The name of the comments author

```

Returns:

```

True (bool): Whenever the strings do not match

```

False (bool): Whenever the strings do match that given question

Definition at line 781 of file `r_rest_Crawl_N_Calculate_Data.py`.

def

`r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.checker_comment_is_question (string_to_check)[static]`

Simply checks whether a given string is a question or not

```

1. This method simply checks whether a question mark exists within that string or not..
    This is just that simple because messing around with natural processing kits to determine the
semantic sense
    would blow up my bachelor work...

```

Args:

```

string to check (str) : The string which will be checked for a question mark

```

Returns:

```

True (bool): Whenever the given string is a question

```

False (bool): Whenever the given string is not a question

Definition at line 739 of file `r_rest_Crawl_N_Calculate_Data.py`.

```
def
r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.checker_comment_is_question_o
n_tier_1 ( string_to_check)[static]
```

```
Simply checks whether a given string is a question posted on tier 1 or not

1. This method simply checks whether a question has been posted on tier 1 by looking whether the
given
    string contains the substring "t3_" or not

Args:
    string to check (str): The string which will be checked for "t3 " appearance in it

Returns:
```

-

Definition at line 761 of file r_rest_Crawl_N_Calculate_Data.py.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.clear_variables ()[static]
```

```
Resets all variables, to not return duplicate objects.
    Because the REST-Service won't destruct the objects by it self we have to reset them manually
here

Args:
    -

Returns:
    -
```

Definition at line 304 of file r_rest_Crawl_N_Calculate_Data.py.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.convert_epoch_to_time (
timeAsString)[static]
```

Definition at line 994 of file r_rest_Crawl_N_Calculate_Data.py.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.create_json_object
()[static]
```

```
Builds a JSON object consisting of all values which have been previously calculated

Args:
    -

Returns:
```

-

Definition at line 1164 of file r_rest_Crawl_N_Calculate_Data.py.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.fill_left_n_top_panel_data (
self)[static]
```

```
Fills data to the left and the top panel

Args:
    self:    Self representation of the class [necessary to use methods within the class itself]

Returns:
```

-

Definition at line 428 of file r_rest_Crawl_N_Calculate_Data.py.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.fill_misc_thread_data  
()[static]
```

Retrieves the creation time stamp and the thread author from the submission

Args:

-

Returns:

-

Definition at line 410 of file r_rest_Crawl_N_Calculate_Data.py.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.fill_right_panel_data ( self,  
id_of_thread)[static]
```

Calculates various statistics for the left panel of the page

Args:

self: Self representation of the class [necessary to use methods within the class itself]

id of thread: The id of the thread which is to be processed

Returns:

-

Definition at line 454 of file r_rest_Crawl_N_Calculate_Data.py.

```
def  
r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.get_n_write_author_information (  
name_of_author)[static]
```

Crawls data from the author into the mongodb

At first all previously stored data will be dropped and then the new one will be crawled.
This may be slow at some times but it enables us to give the user a better iAMA experience,
because
he will immediately receive new data upon posting / requesting.

Args:

name_of_author (str): The name of the author whose data is to be crawled

Returns:

-

Definition at line 184 of file r_rest_Crawl_N_Calculate_Data.py.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.get_thread_submission (  
id_of_thread)[static]
```

Receives the thread information live from Reddit via the Reddit-API

Args:

id_of_thread (str): The id of the thread whose data are to be retrieved and stored globally

Returns:

-
Definition at line 394 of file r_rest_Crawl_N_Calculate_Data.py.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.main_method ( self,  
author_name, id_thread, un_filter_tier, un_filter_score_equals, un_filter_score_numeric,  
un_sorting_direction, un_sorting_type, an_filter_tier, an_filter_score_equals,  
an_filter_score_numeric, an_sorting_direction, an_sorting_type)
```

Defines the main method which will be called by listening on a certain REST-Interface

Args:

self: Self representation of the class [necessary to use methods within the class itself]

author name(str): The name of the author who currently processed threads

id_thread(str): The ID of the thread which will be searched for within the database

un_filter_tier(str) : The kind of tier for which the questions will be filtered accordingly
(all / 1 / x)
for unanswered questions

un_filter_score_equals(str) : The kind of comparison the questions will be filtered on (eq1
/ grt / lrt)
for unanswered questions

un_filter_score_numeric(str): The "number" of score / upvote which will be used to filter the
questions
(int)for unanswered questions

un_sorting_direction(str): The direction the questions will be filtered after (asc / desc)

for unanswered questions

un_sorting_type(str): The type of information the questions will be filtered after

(author, creation, score, random) for unanswered questions

an_filter_tier(str) : The kind of tier for which the questions will be filtered accordingly
(all / 1 / x)
for answered questions

an_filter_score_equals(str) : The kind of comparison the questions will be filtered on (eq1
/ grt / lrt)
for answered questions

an_filter_score_numeric(str): The "number" of score / upvote which will be used to filter the
questions
(int) for answered questions

an_sorting_direction(str): The direction the questions will be filtered after (asc / desc)

for answered questions

an_sorting_type(str): The type of information the questions will be filtered after

(author, creation, score, random) for answered questions

Returns:

create json object (json): A complex json object containing

1. Information about various, thread related statistics

2. All (un)answered questions (& answers) sorted and filtered according to the parameters given

Definition at line 96 of file r_rest_Crawl_N_Calculate_Data.py.

```
def  
r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.prepare_unanswered_questions (  
self)[static]
```

Re-prepares the unanswered questions for correct display on the website

It is necessary to re-prepare and strip down information from the questions.
If we would not do this there would be huge overhead in JSON - rest-transfer..
(i.E. the website does not flags like "answered_by_host" == true, etc..)

Args:

self : Self reference - necessary to use methods within this class

Returns:

-

Definition at line 1075 of file r_rest_Crawl_N_Calculate_Data.py.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.sort_n_filter_questions (  
questions_to_be_sorted, filter_tier, filter_score_equals, filter_score_numeric,  
sorting_direction, sorting_type)[static]
```

Sorts and filters given question lists depending on parameters received via REST call

Args:

questions_to_be_sorted (list): Contains all questions which will be processed later on

filter_tier (str): Contains the information, which questions, depending on the tier, will be sorted out

(all / 1 / X)

filter_score_equals(str): Contains the information to filter a tier depending on a special score (eq [equal] / grt [greater than] / lrt [lesser than])

filter_score_numeric(str): The upvote score which will be used for filtering

sorting_direction(str): The direction which will be used for sorting the questions (asc [ascending] / des [descending])

sorting_type(str): The kind of type which will be used for sorting (author / creation / score / random)

Returns:

-

Definition at line 868 of file r_rest_Crawl_N_Calculate_Data.py.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.test_calculated_values  
() [static]
```

This method is for debugging purpose only. It shows if all values have been calculated the correct way.

Args:

-

Returns:

-

Definition at line 1131 of file r_rest_Crawl_N_Calculate_Data.py.

```
def r_rest_Crawl_N_Calculate_Data.r_rest_Crawl_N_Calculate_Data.uprint ( objects, sep =  
' ', end = '\n', file = sys.stdout)[static]
```

This method is also for debugging purpose only. It helps printing out questions which can not be printed out the normal way because of errors displaying unicode characters (Windows has some problems with it...)

Args:

*objects(object) : The kind of object, which will be used for printing

sep(str) : The separator to separate the printed text

end(str) : Defines whenever the printing should stop

file(object) : Defines where to print that object to

Returns:

-

Definition at line 1105 of file r_rest_Crawl_N_Calculate_Data.py.

r_rest_Login_Behaviour.r_rest_Login_Behaviour Class Reference

Static Public Member Functions

- def [go_to_login_page](#) ()
 - def [sign_in_with_returned_key](#) (sign_key)
-

Detailed Description

Definition at line 28 of file r_rest_Login_Behaviour.py.

Member Function Documentation

def r_rest_Login_Behaviour.r_rest_Login_Behaviour.go_to_login_page () [static]

```
Whenever the REST - service gets initially started this method will be executed

    This method opens an authentication webpage, which will redirect to the route
    '/authorize_callback/' where the sign in key will be getting extracted and logon / posting
behaviour
    will be received

Args:
    -

Returns:
    -
```

Definition at line 31 of file r_rest_Login_Behaviour.py.

def r_rest_Login_Behaviour.r_rest_Login_Behaviour.sign_in_with_returned_key (sign_key) [static]

```
Logs on the user to reddit via using the transmitted sign_key.

    Additionally some user information gets extracted and the ability to post comments on reddit
will be
    achieved in here

Args:
    sign key (str): The key which will be extracted from the authentication url callback

Returns:
    dict to return (dict) : Contains the extracted username and the PRAW (r) object, which is going
to be used
    within 'r_rest_Post_Behaviour' - class

    dict({
'username': authenticated user.name,
'r_object': r
    })
```

Definition at line 49 of file r_rest_Login_Behaviour.py.

r_rest_Post_Behaviour.r_rest_Post_Behaviour Class Reference

Static Public Member Functions

- def [post_comment_on_reddit](#) (r_object, iama_thread_id, id_to_reply_to, comment_text)
-

Detailed Description

Definition at line 9 of file r_rest_Post_Behaviour.py.

Member Function Documentation

def r_rest_Post_Behaviour.r_rest_Post_Behaviour.post_comment_on_reddit (*r_object*, *iama_thread_id*, *id_to_reply_to*, *comment_text*)[static]

The mechanism to reply to questions on reddit is defined here

This class works as described below:

1. It receives the submission object for the given thread_id at first.
2. Now it crawls all comments from reddit, by breaking up the hierarchy
3. It iterates over all comments. Whenever the iterated comments id matches the one the author replied to:
Post the answer of the author to reddit.

Args:

r object (PRAW.object): The prepared r-object, which is necessary to be able to post
iama thread id (str): The thread the iAMA author is currently working on
id to reply to (str): The question id the author is replying to
comment_text (str): The text the author has been posted

Returns:

-

Definition at line 12 of file r_rest_Post_Behaviour.py.

The documentation for this class was generated from the following file:

- [r_rest_Post_Behaviour.py](#)

r_rest_Thread_Overview.r_rest_Thread_Overview Class Reference

Public Member Functions

- def [get_n_return_thread_data](#) (self, author_name)

Static Public Member Functions

- def [get_live_thread_data](#) (thread_id, thread_author_name)

Detailed Description

Definition at line 23 of file r_rest_Thread_Overview.py.

Member Function Documentation

def r_rest_Thread_Overview.r_rest_Thread_Overview.get_live_thread_data (*thread_id*, *thread_author_name*)[static]

```
Retrieves fresh and live data for the given thread id and given thread author name

    This method crawls thread data live from reddit, and does some minor calculation to fit the
    requirements
    of the iAMA Experience prototype website on its left panel

Args:
    thread_id (str): The id of the thread beeing processed
    thread_author_name (str): The author name of the processed thread

Returns:
```

(File): The requested font file

Definition at line 26 of file r_rest_Thread_Overview.py.

def r_rest_Thread_Overview.r_rest_Thread_Overview.get_n_return_thread_data (*self*, *author_name*)

```
Retrieves live data for all threads the author has ever created

Args:
    author name (str): The name of the author which threads are to be processed

Returns:
    json_data (json): Contains various little information for every thread the author has created
                      The structure can be seen down below...

    {
"threads_information": [
    {"title":
    "amount of questions":
    "amount answered":
    "duration":
    "thread_id":}
]
    }
```

Definition at line 185 of file r_rest_Thread_Overview.py.
